

ARE WE READY FOR
WHAT WE ARE CREATING?

AI RESEARCH
PROJECT TEAM

- **INTRODUCTION: AI BETWEEN BENEFITS AND RISKS**

Background

AI is rapidly growing and impacting many fields, but it raises serious concerns such as job loss, privacy issues, and ethical risks.

Objectives

Explore public awareness of AI risks

Analyze concerns about jobs, privacy, and regulations

Examine differences based on age and academic background

Participants

Target: university students & recent graduates

Sampling: convenience sampling via social media

Recruitment: WhatsApp, Facebook, university platforms

Survey Design

Tool: Google Forms questionnaire

≥ 20 questions (MCQ, Likert scale, open-ended)

Covers demographics, AI risks, jobs, privacy, and regulation

• SURVEY DESIGN

1

Data Collection Method

Online questionnaire using Google Forms
Designed to be simple, clear, and user-friendly
Aimed to increase response rate and reduce errors

2

Question Structure

Multiple Choice Questions (MCQ): easy to analyze

Likert Scale (1–5): measure attitudes (Strongly Disagree → Strongly Agree)

Open-ended Questions: capture detailed opinions and insights

3

Number of Questions

At least 20 questions

Balanced to avoid participant fatigue

• Survey Questions Overview ↘

Demographic Questions (2):

Age group

Field of study/work

Closed-Ended Questions (17):

Multiple Choice (MCQ)

Likert Scale (1–5)

Focus on measuring attitudes, behaviors, and perceptions

Open-Ended Question (1):

Allows participants to express personal opinions and experiences

Extra Questions:

1 additional core question

1 repeated/validation question (for data quality)

1 optional feedback question

• Question Structure & Design

Research Focus

Study explores how people feel about AI, not just what it does
Focus on impact on:
Career & future
Thinking & cognition
Self-esteem & relationships

Target Population

Age group: 12–55 years
Includes students, professionals, and AI users
People who interact frequently with AI tools

Key Themes Measured

Career Impact: job security, dependence on AI
Cognitive Impact: focus, creativity, thinking depth
Social & Emotional Impact: trust, relationships, self-confidence

Data Collection Methods (Core Idea)

2 methods:
Online Survey (Main Tool):
20 questions (mostly closed-ended + 1 open)
Easy, clear, and structured
Interactive Game/Quiz:
“AI Impact Score”

We didn't just collect data... we captured how people actually *feel* about AI

• Sampling and Pretests

Sample Description

- **Target Audience:** The survey reached over 30 participants from diverse age groups and professional backgrounds.
- **Demographics:** The majority of respondents (72.7%) were in the **18-24 age group**.
- **Professional Fields:** Participants represent various sectors, including **Technology/Engineering (54.5%)**, Business/Finance, Education, and Healthcare.
- **Language Preference:** **70.3%** of respondents preferred the Arabic version of the survey, while **29.7%** chose English.

Pretest and Survey Refinement

- **Clarity & Simplification:** Long and complex questions were shortened to improve clarity.
- **Language Consistency:** The survey was revised to maintain a uniform language, removing the mix between formal and colloquial Arabic.
- **Reducing Ambiguity:** Vague items were rephrased to ensure consistent interpretation across all respondents.
- **Key Changes:** Focus-time questions were simplified, and new items regarding **privacy and data security** were added based on feedback.

• Sampling and Pretests (Cont.)

Key Findings: AI Engagement & Productivity

- **Usage Frequency:** High engagement was observed; **36.4%** use AI tools 1-3 times daily, while **18.2%** use them more than 3 times a day.
- **Independence:** While AI enhances productivity, participants are not fully dependent; **45.5%** stated they could complete their work easily without AI, though it might be slower.
- **Focus:** **36.4%** believe AI improves their focus, while **45.5%** reported no change in concentration.

AI Ethics and Future Concerns

- **Off-Limit Areas:** Respondents strongly believe AI should NOT be used in:
 - Military or war decisions (54.5%).
 - Medical life-or-death decisions (54.5%).
 - Legal judgments (36.4%).
- **Job Displacement:** Over half of the participants (54.5%) feel it is likely that AI could replace their jobs or future careers within the next 10 years.
- **Human Control:** A significant portion (45.5%) expressed concern that superintelligent AI could potentially surpass human control.

• AI in Our Lives: Between Convenience & Danger

- Survey conducted on **302** participants (mostly aged 18–24), **Aim:** understand how AI is affecting people's lives and thinking, The study is structured into 3 main stories

Story 1 – Age & Brain Rot

- AI is impacting **focus and depth of thinking**
- 54.6%** feel their thinking became more shallow
- 78.8% rely on AI for thinking or brainstorming**
- The issue is behavioral, not age-related

Key takeaway: Only 21.2% think through problems independently before consulting AI. The majority — 78.8% — either immediately turn to AI or use it as a primary brainstorming tool, suggesting a significant dependency on algorithmic thinking assistance

• AI in Our Lives: Between Convenience & Danger (Cont.)

Story 2 – Has AI Changed Our Existence?

Key Points:

- AI is influencing not only work, but also **thinking and emotions**
- **16.9% trust AI more than human experts**
- **20.5% use AI for emotional responses**
- Indicates a shift in:
 1. Independent thinking
 2. Emotional authenticity

Key takeaway: While 43% still respond personally to emotional messages, nearly 30% either delay, delegate to AI, or send brief replies. Combined with 16.9% who trust AI over human experts, a quiet shift in emotional reliance is underway

• AI in Our Lives: Between Convenience & Danger (Cont.)

Story 3 – The Beginning of the End

Key Points:

- High level of concern about AI's future
- **74% believe AI could take control**
- Paradox:
→ People building AI are the most afraid of it
- Main concerns:
 1. Job replacement
 2. Loss of control
 3. Uncertain future

Key takeaway: Nearly half see AI as an existential threat, yet Technology & Engineering professionals — the very people building AI — are the most alarmed. This paradox of conscious dependency defines our era: we are knowingly constructing the thing we fear

Data analysis

01

Data Preprocessing & Methodology

- **Rigorous Cleaning:** Removed duplicates and handled missing values across **302 records** and **29 features**.
- **Feature Engineering:** Standardized complex multi-choice responses (like restricted AI areas) and mapped numerical survey scales into readable categories (e.g., Privacy Concerns).
- **Encoding:** Converted categorical text into numeric ranks (Ordinal Encoding) to enable advanced machine learning analysis.

02

Revealing Story 1: "Age and Brain Rot"

- **Cognitive Impact:** **54.6%** of respondents feel their thinking has become **shallower** since using AI.
- **Dependency:** Only **21.2%** think through problems independently before consulting AI.
- **Unexpected Trend:** The **45-54 age group** reported the highest rate of severe "shallow thinking" (**58.8%**), suggesting this is a behavioral issue, not just a generational one.

Data analysis (Cont.)

04

Revealing Story 3: "The Beginning of the End"

- **Existential Threat:** 46% view AI as the "beginning of the end of human control," while 90% see it as a danger with unknown consequences.
- **The Paradox:** Tech and Engineering professionals—the ones building AI—are often the most alarmed.
- **"Locked Out" Areas:** Strong consensus that AI should **never** be used in:
 - **War & Weapons** (Top restricted area).
 - **Legal Decisions.**
 - **Medical Life-or-Death Decisions.**

03

Revealing Story 2: "Changed Existence"

- **Shifting Trust:** 16.9% now trust AI logic over human experts when opinions differ.
- **Emotional Delegation:** 20.5% use AI to write or organize emotional messages to friends, indicating an erosion of personal "presence".
- **Social Acceptance:** 19% of users are open to accepting AI as a "Loyal Friend".

Data analysis (Cont.)

05

Advanced Predictive Modeling

- **Performance Prediction:** A tuned **XGBoost Regressor** predicted user "Game Scores" with **62.6% accuracy** ($R^2=0.6262$).
- **Key Predictors:** The most influential factors on user performance were their **opinion of AI**, **brainstorming style**, and **attention span**.
- **NLP Insights:** Text analysis of the "Life without AI" responses associated the technology with **speed and efficiency**, while a lack of AI was linked to **increased difficulty and effort**.

06

Final Conclusion

- The research highlights that AI is not just a tool for productivity; it is actively restructuring **human trust and judgment**.
- Users are segmented into three types: **Cautious Independents**, **Digital Reliants**, and **Ambivalent Users**.
- The transition is moving from "**I think**" to "**I ask AI**," potentially stealing a part of our humanity in exchange for convenience.

Conclusion & Key Findings

The majority remain unprepared for AI risks despite growing awareness. Significant ethical concerns remain unaddressed across all sectors. This demands an urgent call to action: immediate policy reform and comprehensive awareness initiatives are critical before it's too late.

Research Team

Our dedicated team of experts driving this critical research initiative: Team Lead overseeing project direction and methodology, Data Analysts processing and interpreting complex findings, and Field Researchers gathering essential primary data.
